Fingerprint Door Lock is a type of password door lock that uses fingerprint recognition technology to unlock the door. This technology works by capturing an image of the user's fingerprint and storing it in the lock's memory. When the user wants to unlock the door, they place their finger on the keypad and wait for the lock to recognize their fingerprint. If the fingerprint matches the one stored in the lock's memory, the lock will open, and the user can enter their home or office.
